Introduction

Why flavour physics? Some *B* physics anomalies

- Theoretical interest: why do fermions have a large range of masses  $(m_t/m_e \approx 350000)$ ?
- Flavour physics is (one of) the best places to look for New Physics.
  - Flavour Changing Neutral processes are heavily suppressed in the SM (loop and mass suppressed).
  - But New Physics might be not so suppressed: sizable contributions.
- Experiments are capable of good sensitivities: LHCb, BaBar, Belle.

- Rare B decays:  $b \to s \mu^+ \mu^-$  and  $b \to s e^+ e^-$ :
  - $\qquad R_{K^{(*)}} = \frac{\mathcal{B}(B \to K^{(*)} \mu^+ \mu^-)}{\mathcal{B}(B \to K^{(*)} e^+ e^-)}.$
  - $R_K^{\text{SM}} = 1.00 \pm 0.01, \qquad R_K^{\text{exp}} = 0.745^{+0.090}_{-0.074} \pm 0.036,$   $(2.6\sigma).$
  - $R_{K^*}^{\text{SM}} = 1.00 \pm 0.01, \qquad R_{K^*}^{\text{exp}} = 0.685_{-0.069}^{+0.113} \pm 0.047,$   $(2.5\sigma).$
  - Angular observables  $P'_4$ ,  $P'_5$ .
  - Violation of Lepton Flavour Universality?

 $\blacksquare$   $B_s$  mixing:

■ 
$$\Delta M_S^{\text{SM}} = 20.01 \pm 1.25 \,\text{ps}^{-1},$$
  
 $\Delta M_S^{\text{exp}} = 17.757 \pm 0.021 \,\text{ps}^{-1},$  (1.8 $\sigma$ ). <sup>3</sup>
